## Welcome to Leetcode Study Group!

#### Before we begin...

- Session materials: https://github.com/WomenWhoCode/WWCodePython
- Set your chat to "All panelists and attendees" and share your thoughts there
- Ask any questions using the Q&A button
- Have fun and make some coding friends!

# WELCOME

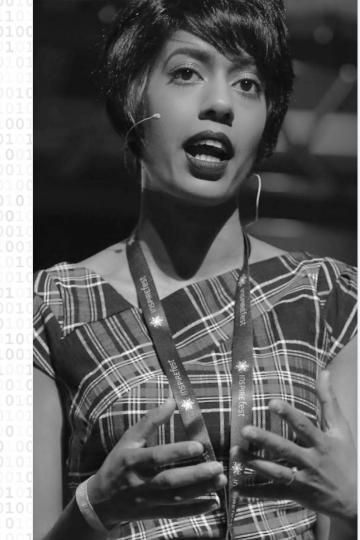

## WOMEN WHO

# Our Mission

Inspiring women to excel in technology careers.

# Our Vision

A world where diverse women are better represented as engineers and tech leaders

## Our Values

- + Focus on the mission
- + Live Leadership
- + Punch above your weight
- + Inclusion at the core

# Our Target

Engineers with two or more years of experience looking for support and resources to strengthen their influence and levelup in their careers.

# 290,000

## Members

70 networks in 20 countries

122+ countries

14K+ events

\$1025 daily Conference tickets

\$2M Scholarships

Access to jobs + resources

Infinite connections

# OUR MOVEMENT

As the world changes, we can be a connecting force that creates a sense of belonging while the world is being asked to isolate.

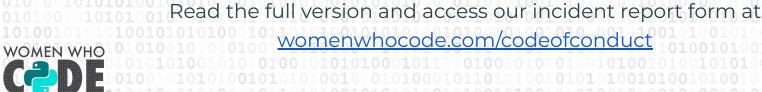

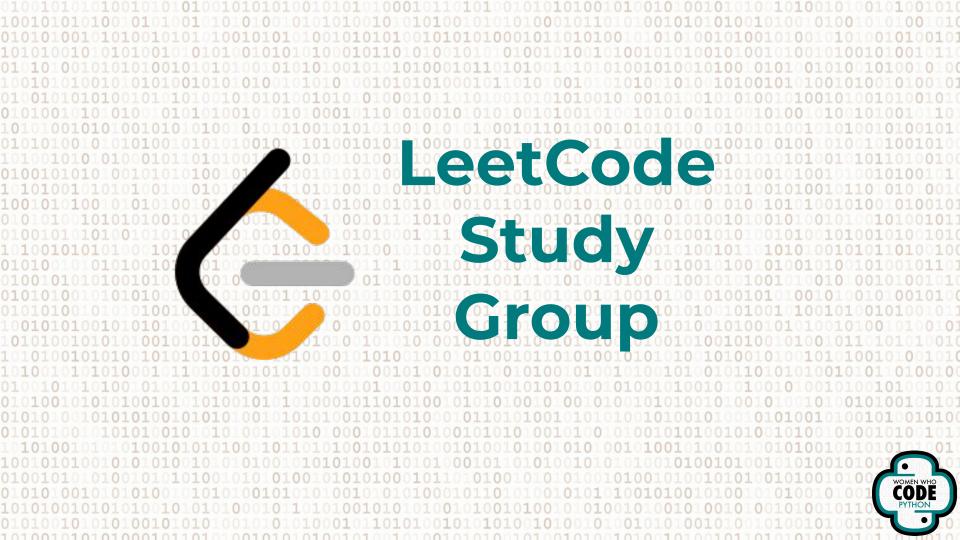

## Code of Conduct

WWCode is an inclusive community, dedicated to providing an empowering experience for everyone who participates in or supports our community, regardless of gender, gender identity and expression, sexual orientation, ability, physical appearance, body size, race, ethnicity, age, religion, socioeconomic status, caste, creed, political affiliation, or preferred programming language(s).

Our events are intended to inspire women to excel in technology careers, and anyone who is there for this purpose is welcome. We do not tolerate harassment of members in any form. Our Code of Conduct applies to all WWCode events and online communities.

Meet Your Team! Chethana Karen Lead / Associate Software Engineer Lead / Programmer

- 1. Introduction to Backtracking
- 2. Deep dive of Subsets
  - a. Problem Discussion
  - b. Test cases
  - c. Approaches with time complexity
  - d. Live coding
- 3. Next problems to tackle
- 4. Q&A

#### Quick intro

- Backtracking is a general algorithm that is used to find solutions to computational problems
- How are solutions found?
  - At each iteration/recursion level
    - a) Extend the current solution
    - b) Correct solution?
      - Yup! Record it somewhere.
      - Nah: / try to extend it somehow and continue!

#### Template of some sort?

```
backtrack(call with empty solution, starting index etc)
backtrack(curr_partial_solution, curr_index)

                            if curr_partial_solution is solution of the contract of the co
                                                         record it, return
                                                        add to curr_partial_solution
                                                         backtrack(extended_curr_partial_soln, curr_index+1)
                                                           remove from curr_partial_solution i
```

#### Where and when to use?

- When you have a whole search space which could contain multiple incorrect and correct answers and you'd have to build your way to the correct ones leaving out the incorrect
- Find all combinations, permutations exhausting the search space or choosing specific candidates for solutions
- Many times it's very slow and more of a brute force but sometimes the brute force solution is good enough

#### Subsets

#### <u>Link to problen</u>

"Given an integer array **nums** of **unique** elements, return all possible subsets (the power set).

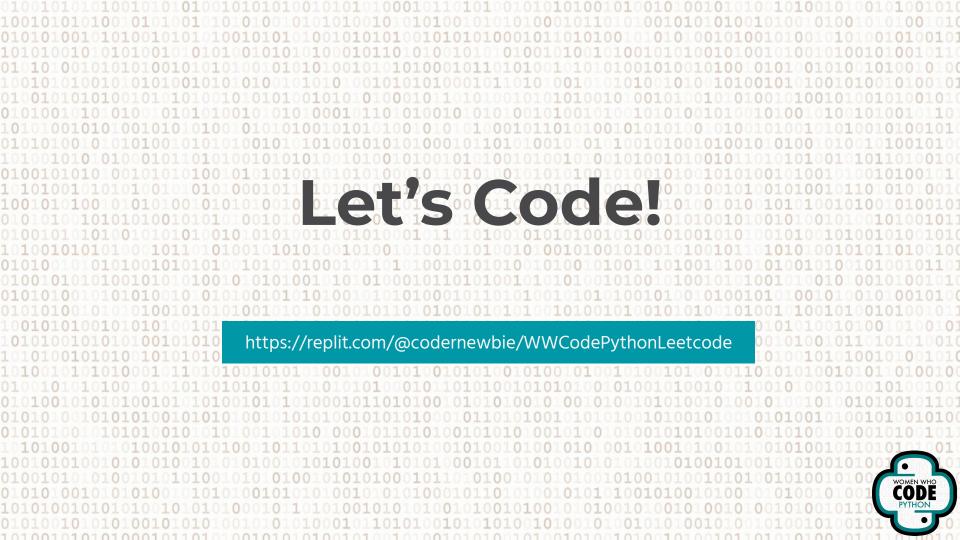

The solution set **must not** contain duplicate subsets. Return the solution in **any order**"

### Simplifying that

- Subset?
  - Eg,. [1, 2] => [ ], [1], [2], [1, 2]
- Power set?
  - => Set of all subsets within set S
- Input -> nums = [1, 2, 3]
- Output -> power set of nums
- Solution can be in any order and no duplicates

#### Next steps from here

#### **Word Search**

"Given an m x n grid of characters board and a string word, return true if word exists in the grid."

#### Letter Combinations of a Phone Number

"Given a string containing digits from 2-9 inclusive, return all possible letter combinations that the number could represent. Return the answer in any order"

(Also, all subsets, <u>permutations</u>, <u>combination sum</u> variations on Leetcode)
